Store Sales Forecast

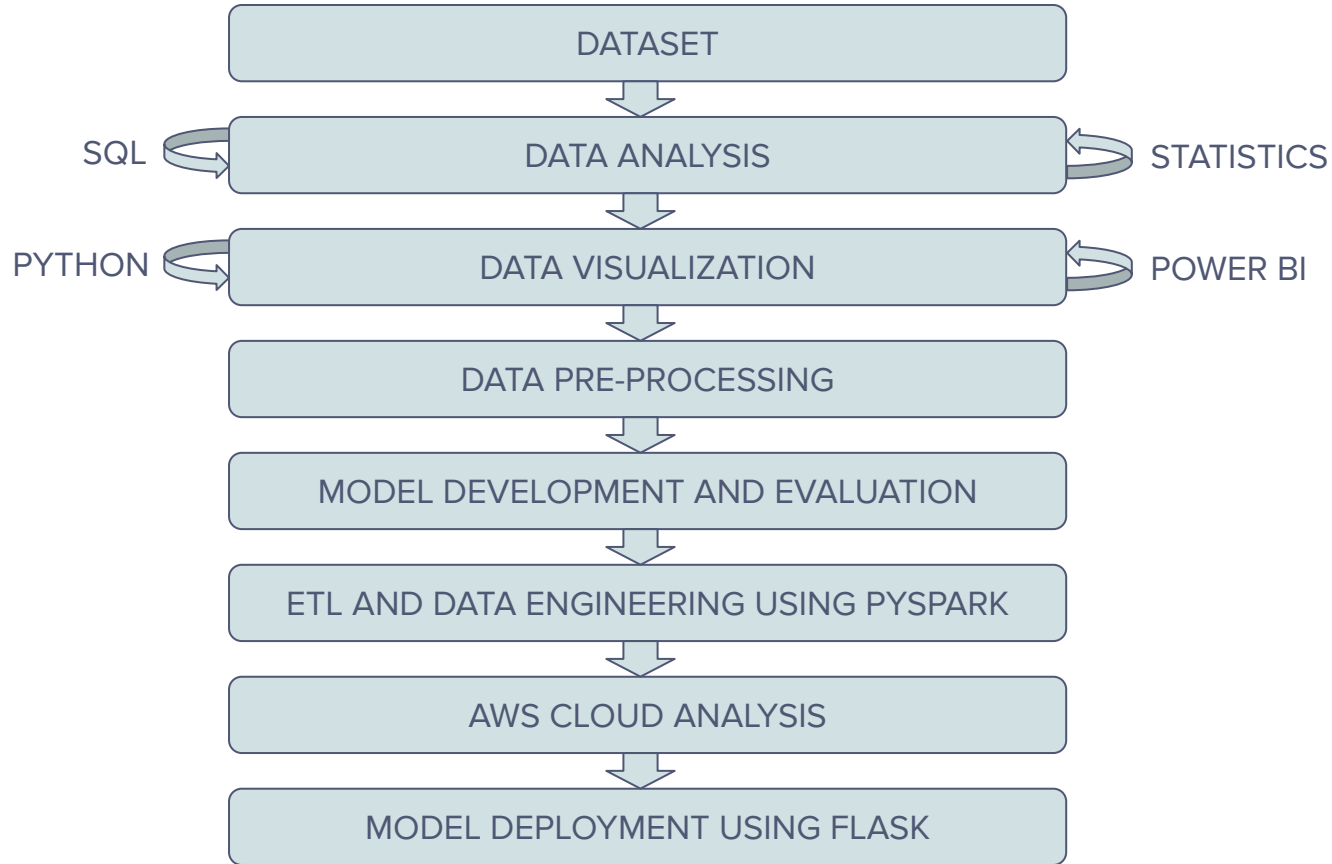

Problem Statement

Dean's is a large web e-trailer chain which sells different types of products nationally. It has shopping services via different modes/types of transportation. It keeps track of order details, shipping details, discounts, provided to the customer, profit earned etc.

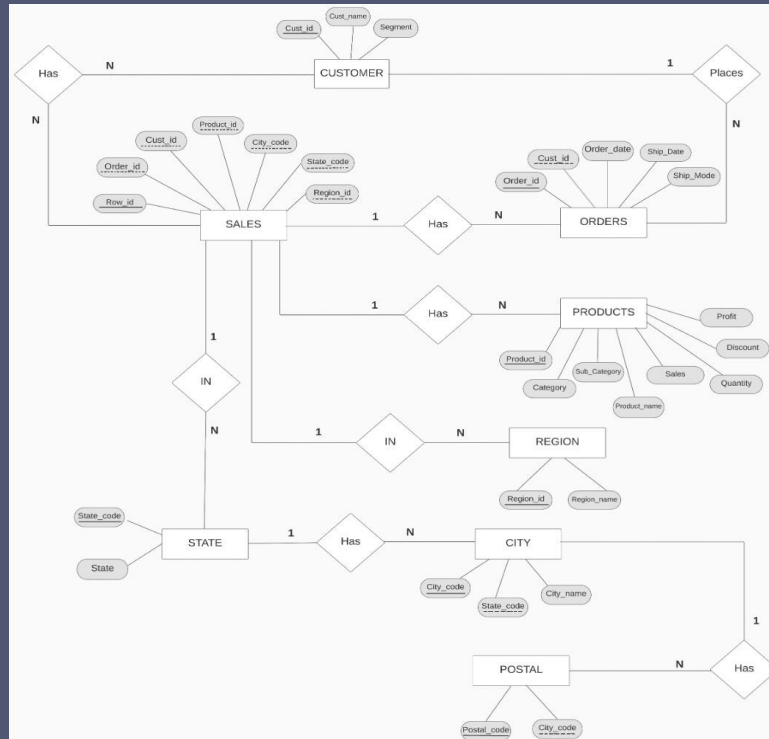

Solution

- To preprocess and aggregate the data into monthly sales
- To identify various factors in the data such as trend, seasonality and stationarity, etc
- To build various forecasting models for the time series data for forecasting sales in future
- Comparing all the forecasting models based on RMSE value to find the best one

IMPLEMENTATION

Data Analysis Using SQL

Data Visualization Using PowerBI

The Central Region has the highest sales

Region_Name ● Central

Total sales of Central Region

\$501.24K

Sales

Total Profit in Central Region

\$40K

Profit

Product Categories fall beneath the overall average profit

Category ● Furniture ● Office Supplies ● Technology

\$29

Average of Profit

The City with Highest Sales in California

State ● California

Total Profit in California

\$76K

Profit

The top 10 Product Names by Sales within each region

Product Name ● Canon ima... ● Cisco TelePr... ● Fellowes P... ● GBC Docu... ● GBC Doc... ● GBC Ibimast... ● Hewlett Pa... ● High Spe... ● HON 540... ● HP Desig... ● Lexmark ... ● Martin Val...

Data Visualization Using PowerBI

Product with highest demand in each segment

Segment ● Consumer ● Corporate ● Home Office

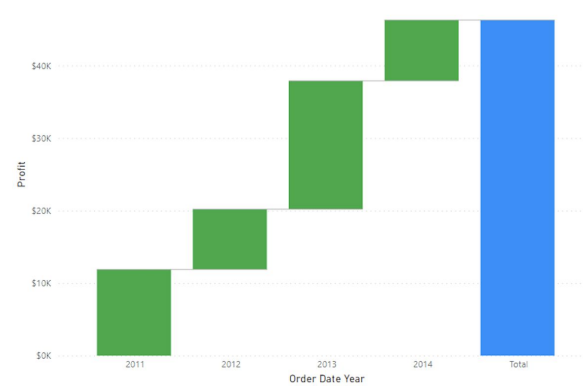

product is ranked #2 by Sales in the West region

Region_Name ● West

Trend in profit/sales over region

● Increase ● Decrease ● Total

Select any region name to see the trend of particular Region

Data Preprocessing

```
Row ID      0

```

Data pre-processing steps are normally used to convert the raw data into clean data set that can be used for training the model.

- Null Value Detection and Treatment
- Outlier Analysis and Treatment
- Data Encoding
- Data Scaling and Transformations
- Feature Engineering
- Splitting into Train and Test

```
timeSeriesDF = df[['Order Date', 'Sales']]
timeSeriesDF.columns = timeSeriesDF.columns.str.replace('-', '_')
timeSeriesDF['Order_Date'] = timeSeriesDF['Order Date'].str.replace('-', '/')
timeSeriesDF['Order_Date'] = pd.to_datetime(timeSeriesDF['Order_Date'])
timeSeriesDF.head()
```

| | Order_Date | Sales |
|---|------------|----------|
| 0 | 2013-11-09 | 261.9600 |
| 1 | 2013-11-09 | 731.9400 |
| 2 | 2013-06-13 | 14.6200 |
| 3 | 2012-10-11 | 957.5775 |
| 4 | 2012-10-11 | 22.3680 |

ML Part

ETL and Data Engineering Using PySpark

- Load data from local file system to Hadoop Cluster using Hive Table
- Using Spark Session, load the data from Hive table to the Spark DataFrame
- Null Value Identification and Outlier Analysis and treatment of both using Spark
- Data Profiling using Spark
- Execute SQL Commands using Spark
- Save the data in parquet form for later use, using Spark

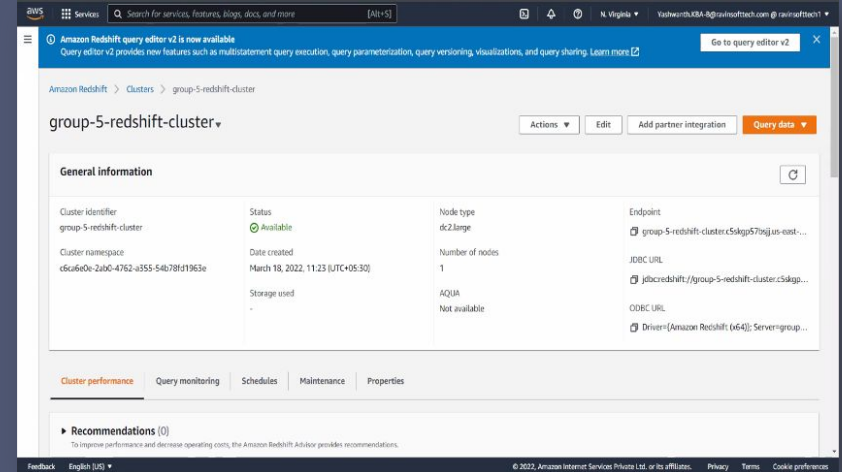

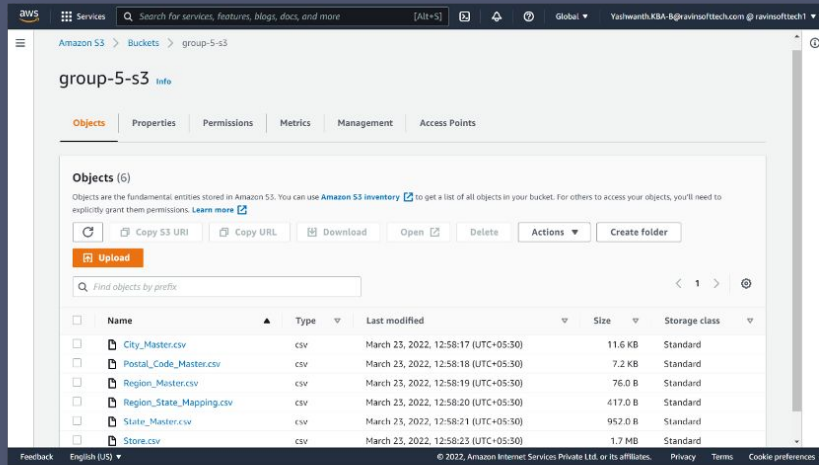

[illegible]

-
- The diagram illustrates a data pipeline. It starts with a green Microsoft Excel icon on the left. An arrow points from the Excel icon to a red Google Cloud Storage bucket icon in the center. Another arrow points from the bucket icon to a blue Google BigQuery icon on the right. A final arrow points from the BigQuery icon down to a yellow Google Data Studio dashboard icon at the bottom.

AWS Cloud Analysis

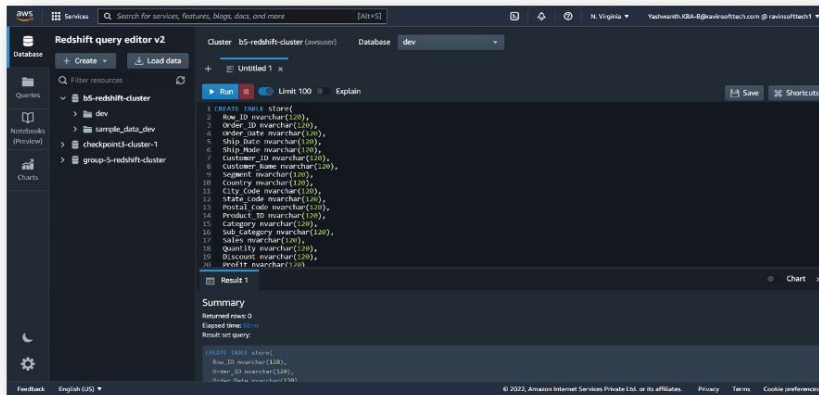

We made an AWS S3 Bucket and moved all the datasets into the same and we also created a Redshift Instance.

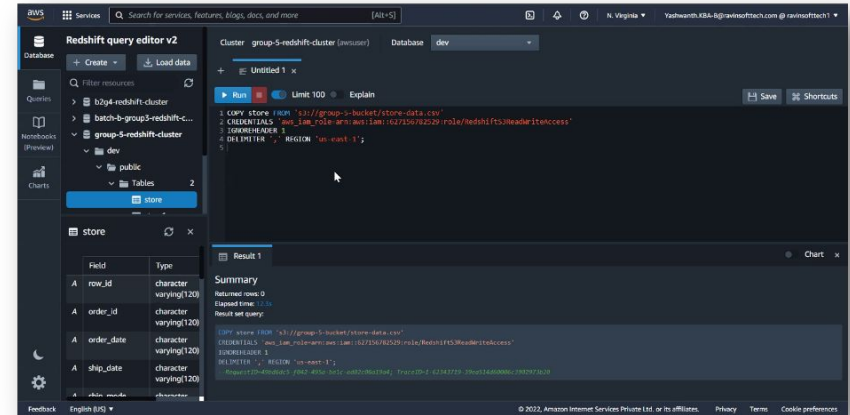

AWS Cloud Analysis

We then made tables in Redshift and moved the data from S3 into the created tables using COPY command.

```
1 CREATE TABLE store(
2   Row_ID varchar(120),
3   Order_ID varchar(120),
4   order_date varchar(120),
5   Ship_date varchar(120),
6   Customer_ID varchar(120),
7   Customer_name varchar(120),
8   Segment varchar(120),
9   Country varchar(120),
10  City_code varchar(120),
11  State_code varchar(120),
12  Postal_code varchar(120),
13  Product_ID varchar(120),
14  Sub_Category varchar(120),
15  Sales varchar(120),
16  Quantity varchar(120),
17  Discount varchar(120),
18  Profit varchar(120))
```

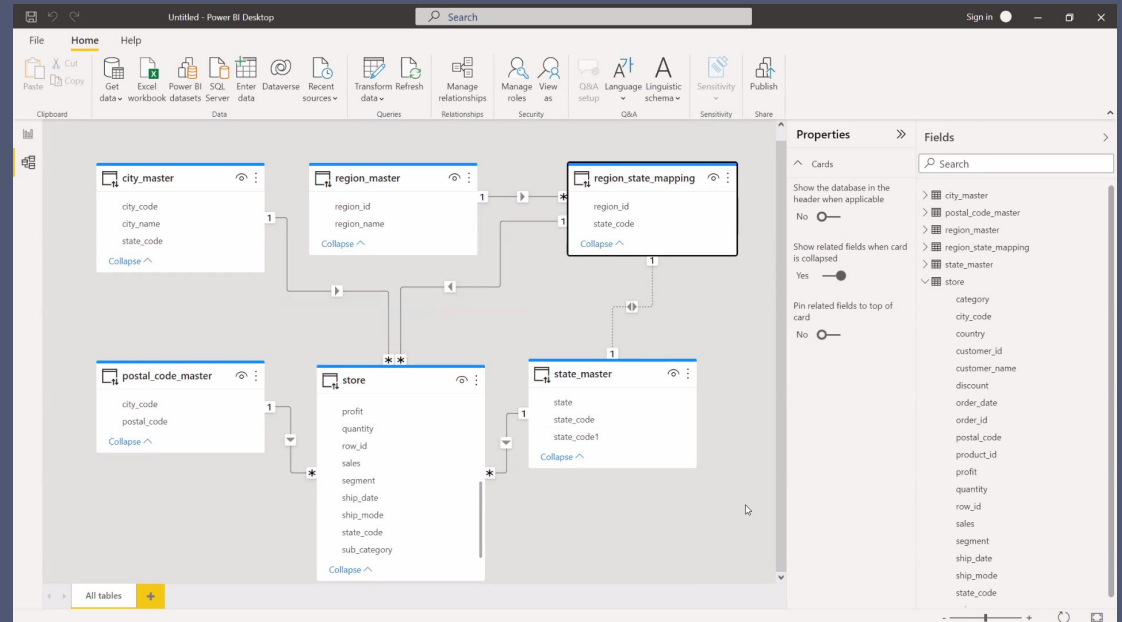

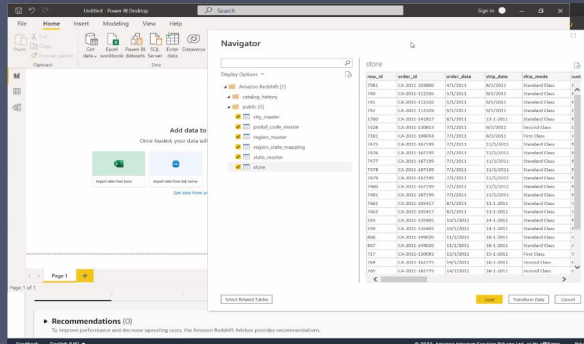

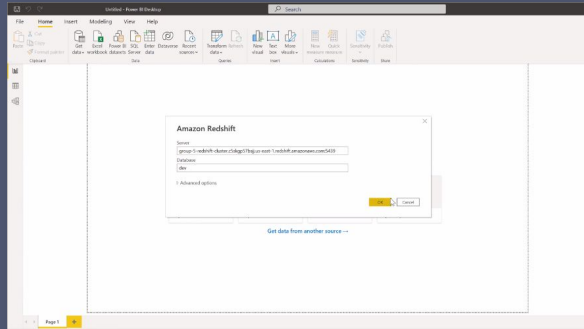

```
1 COPY store FROM 's3://group-5-bucket/store-data.csv'
2 CREDENTIALS 'aws_iam_role=arn:aws:iam:123456789012:role/RedshiftFSWAccess'
3 UNKOWNHEADER 1
4 DELIMITER ',' REGION 'us-east-1'
```

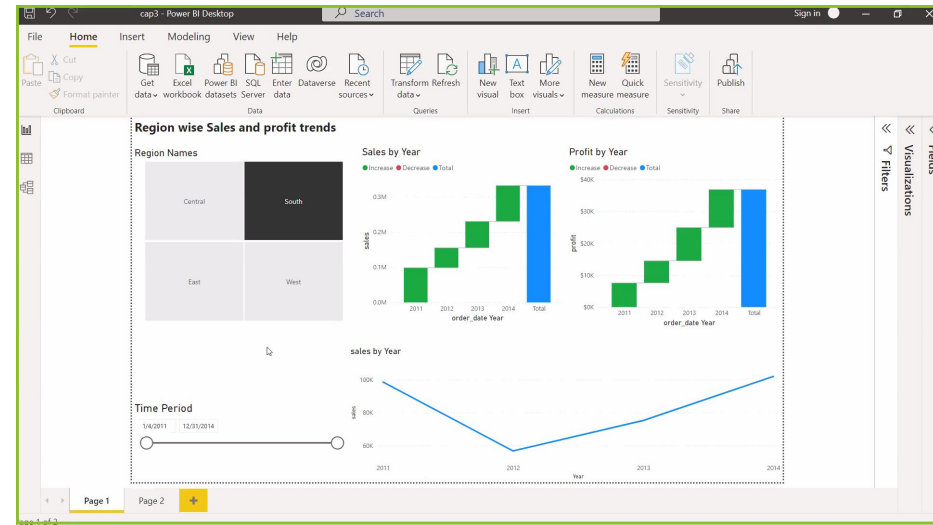

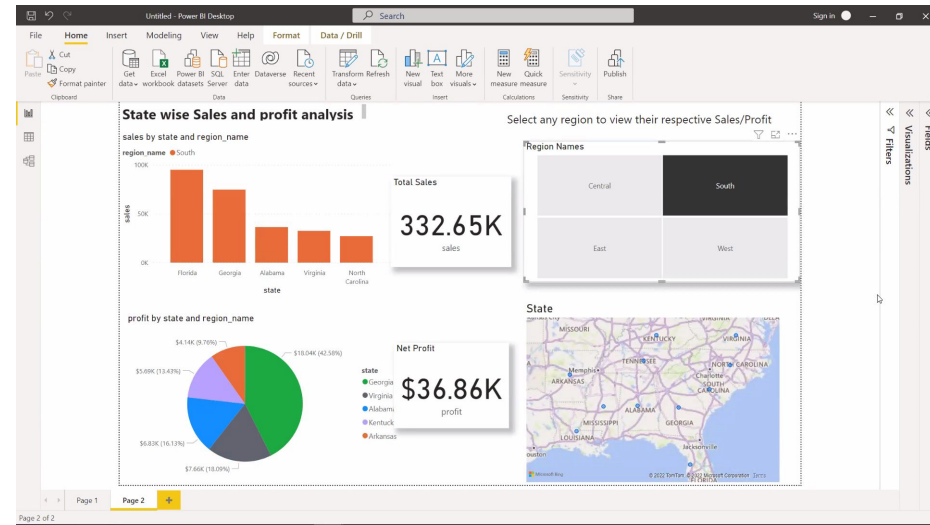

AWS Cloud Analysis

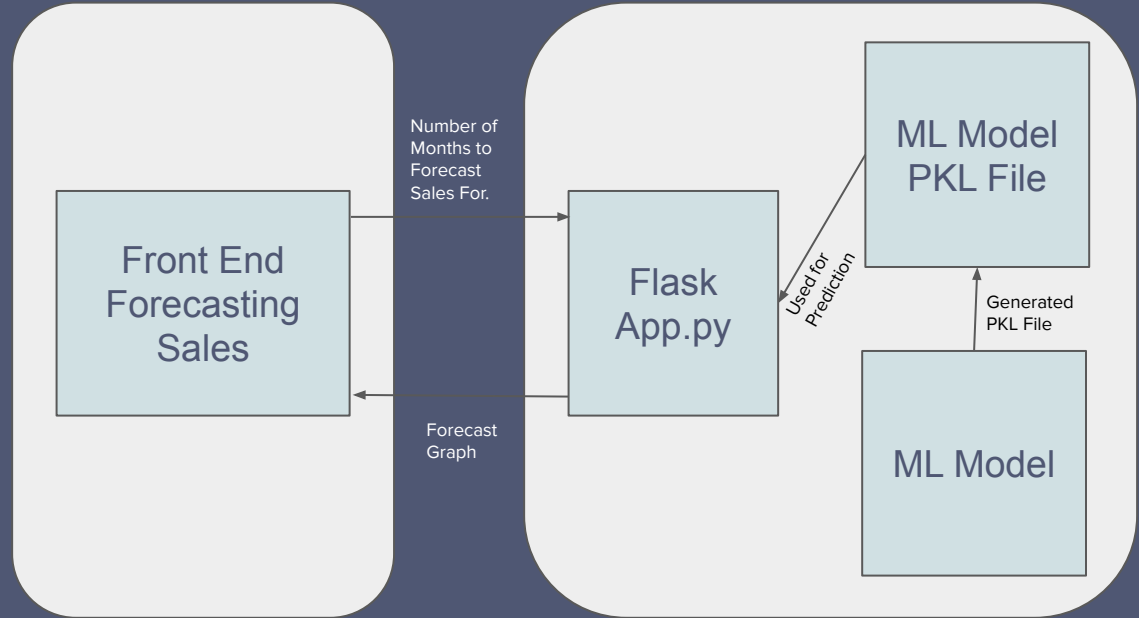

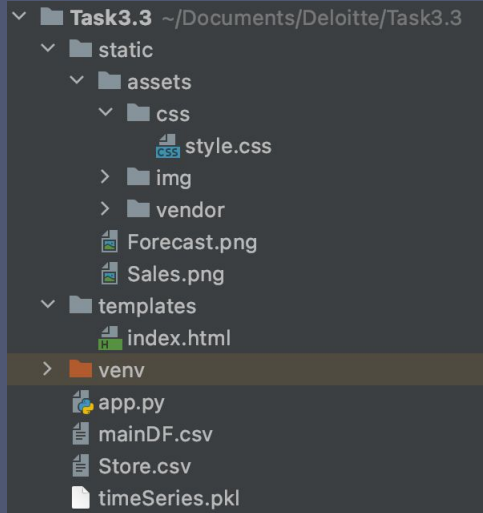

We then connected Redshift to PowerBI and checked the relationship between all the tables created
